

# Sec 1 Math: Basic Geometry

## A) Angle Types

Angles	Definition	**How to Remember?
<b>Acute Angle</b>	$0^\circ < x < 90^\circ$	<b>Acute</b> angles are small. So it is a <b>"Cute"</b> angle.
<b>Obtuse Angle</b>	$90^\circ < x < 180^\circ$	<b>Obtuse</b> angles are fat and wide. They are the <b>Obese</b> angles.
<b>Reflex Angle</b>	$180^\circ < x < 360^\circ$	<b>Reflex</b> angles occur on the <b>Reverse</b> side of any acute or obtuse angles.

## B) Complementary and Supplementary Angles

**Complementary Angles:** Two angles that add up to  $90^\circ$  are complementary angles.

Angles  $x$  and  $y$  are complementary angles.

**Supplementary Angles:** Two angles that add up to  $180^\circ$  are supplementary angles.

Angles  $a$  and  $b$  are supplementary angles.

**\*\*How to Remember?**

Complementary  $\rightarrow$  Corner ( $90^\circ$ )

Supplementary  $\rightarrow$  Straight Line ( $180^\circ$ )

## C) Recap of Basic Angle Properties

Angles at a Point

The sum of angles at a point is  $360^\circ$ .

$$x + y + z = 360^\circ \quad (\text{Angles at a Point})$$

Adj Angles on a Straight Line

Sum of adjacent angles on a str line is  $180^\circ$

$$a + b + c = 180^\circ \quad (\text{Adj Angles on a str line})$$

Vertically Opposite Angles

Given two straight lines that intersect.

The opposite angles are equal

$$\angle k = \angle m \quad (\text{Vert. Opp. Angles})$$

## D) Parallel Lines and Transversal

When there are two parallel lines and a straight transversal line intersects with both parallel lines, the following properties can be applied:

Alternate Angles (Z)

\*Learned in primary school as the Z-shape

$$\angle x = \angle y \quad (\text{Alt. angles})$$

Interior Angles (C)

\*Learned in primary school as the C-shape

$$\angle a + \angle b = 180^\circ \quad (\text{Int. angles})$$

Corresponding Angles (F)

\*Learned in primary school as the F-shape

$$\angle k = \angle m \quad (\text{Corr. angles})$$

**\*\*\*Note: We have learned most of these angle properties in primary school. In secondary school, we need to learn the names of each property and present our work properly.**

## E) Worked Example (Basic)

In the above diagram,  $AB$  is parallel to  $DE$ . Find the value of  $x$ .

\*Note: To solve this question, we have to draw a line that passes through  $C$  and is parallel to the other two parallel lines.

$$\begin{aligned} \angle PCB &= 180^\circ - 115^\circ \quad (\text{Int. angles, } AB//PC) \\ &= 65^\circ \end{aligned}$$

$$\begin{aligned} \angle QCD &= 180^\circ - 110^\circ \quad (\text{Int. angles, } DE//CQ) \\ &= 70^\circ \end{aligned}$$

$$\begin{aligned} x &= 180^\circ - 65^\circ - 70^\circ \quad (\text{Adj. angles on a str. Line}) \\ &= 45^\circ \end{aligned}$$

**\*\*\*Note: Presentation and Property names are very Important!**

## F) Worked Example (Intermediate)

In the diagram,  $AB$  is parallel to  $DE$ .

Find the value of  $x$ .

\*Note: To solve this question, we have to draw a line that passes through  $C$  and is parallel to the other two parallel lines.

\*Note: We will also need to form algebraic equations to solve the problem easily.

$$\angle DCP = 2x^\circ - 24^\circ \quad (\text{alt. angles, } DE//PQ)$$

$$\angle PCB = 180^\circ - (5x^\circ + 13^\circ) \quad (\text{int angles, } AB//PQ)$$

$$= 180^\circ - 5x^\circ - 13^\circ$$

$$= 167^\circ - 5x^\circ$$

$$(2x^\circ - 24^\circ) + (167^\circ - 5x^\circ) + 295^\circ = 360^\circ \quad (\text{Angles at a Point})$$

$$2x^\circ - 5x^\circ = 360^\circ + 24^\circ - 167^\circ - 295^\circ$$

$$-3x^\circ = -78^\circ$$

$$x = 26$$

**\*\*Note:  $\angle DCP$  is NOT equals to  $\angle PCB$ !!!**

## G) Worked Example (Intermediate)

In the diagram,  $AC$ ,  $DE$  and  $FH$  are parallel.  $DG//KE$ ,  $\angle BAG = 47^\circ$  and  $\angle DEB = 113^\circ$ . Find the values of  $p^\circ$ ,  $q^\circ$ ,  $r^\circ$  and  $s^\circ$ .

$$p^\circ = 47^\circ \quad (\text{alt. angles, } AC//FH)$$

$$\angle EDG = 113^\circ \quad (\text{alt. angles, } DG//BE)$$

$$r^\circ = 180^\circ - 113^\circ \quad (\text{int. angles, } DE//GH)$$

$$= 67^\circ$$

$$q^\circ = 180^\circ - 47^\circ - 67^\circ \quad (\text{adj. angles on a str. Line})$$

$$= 66^\circ$$

$$\angle ABE = 180^\circ - 113^\circ \quad (\text{int. angles, } DE//AC)$$

$$= 67^\circ$$

$$s^\circ = 67^\circ \quad (\text{Vert. Opp. Angles})$$

**\*\*Note: Some questions have more than one pair of parallel lines. Do make sure to consider properties of every pair parallel lines. Rotate the paper if you have difficulty identifying.**

## Self Practice

### Worked Example (Basic)

In the above diagram,  $AB$  is parallel to  $DE$ . Find the value of  $x$ .

### Worked Example (Intermediate)

In the diagram,  $AB$  is parallel to  $DE$ . Find the value of  $x$ .

### Worked Example (Intermediate)

In the diagram,  $AC$ ,  $DE$  and  $FH$  are parallel.  $DG \parallel KE$ ,  $\angle BAG = 47^\circ$  and  $\angle DEB = 113^\circ$ . Find the values of  $p^\circ$ ,  $q^\circ$ ,  $r^\circ$  and  $s^\circ$ .
